Dataset 1

Invoices With Merged Categories and Merged Amounts

Because a single transaction (identified with an order id) has multiple items purchased, who ever captured this data decided to create a single row for each order, thereby lumping the different items purchased and the amounts together into 2 fields respectively.

The better thing to do is to let each item purchased be on a single row with the amount. It is better to repeat the Order IDs on different rows than lumping up amounts in a single cell. We would be analyzing items bought and amounts a lot, we need them separated into rows.

#Dataset 2 # Medicine Data With Combined Quantity and Measure Going by clean data rules, you should have every field/column represent unique things. So split the combined Quantity and Measure on this data into separate columns/fields. When you are done, your Quantity column should sum up to 17,600.00. You will find this total on the clean worksheet once you download.

Dataset #3 - a work order process at a manufacturing site

Question: What is the distribution of work order status by Building and Type? This was taken from slack uploads by Sam

```
library(dplyr)
library(tidyr)
library(tidyxl)
library(ggplot2)
```

```
Order_data <- readxl::read_excel("~/Downloads/Example of a work order process at a manufacturing site.xls")
```

```
head(Order_data)
```

```
